## 3.2 BINARY SEARCH TREES

---

- ▶ *BSTs*
- ▶ *ordered operations*
- ▶ *deletion*

# ST implementations: summary

---

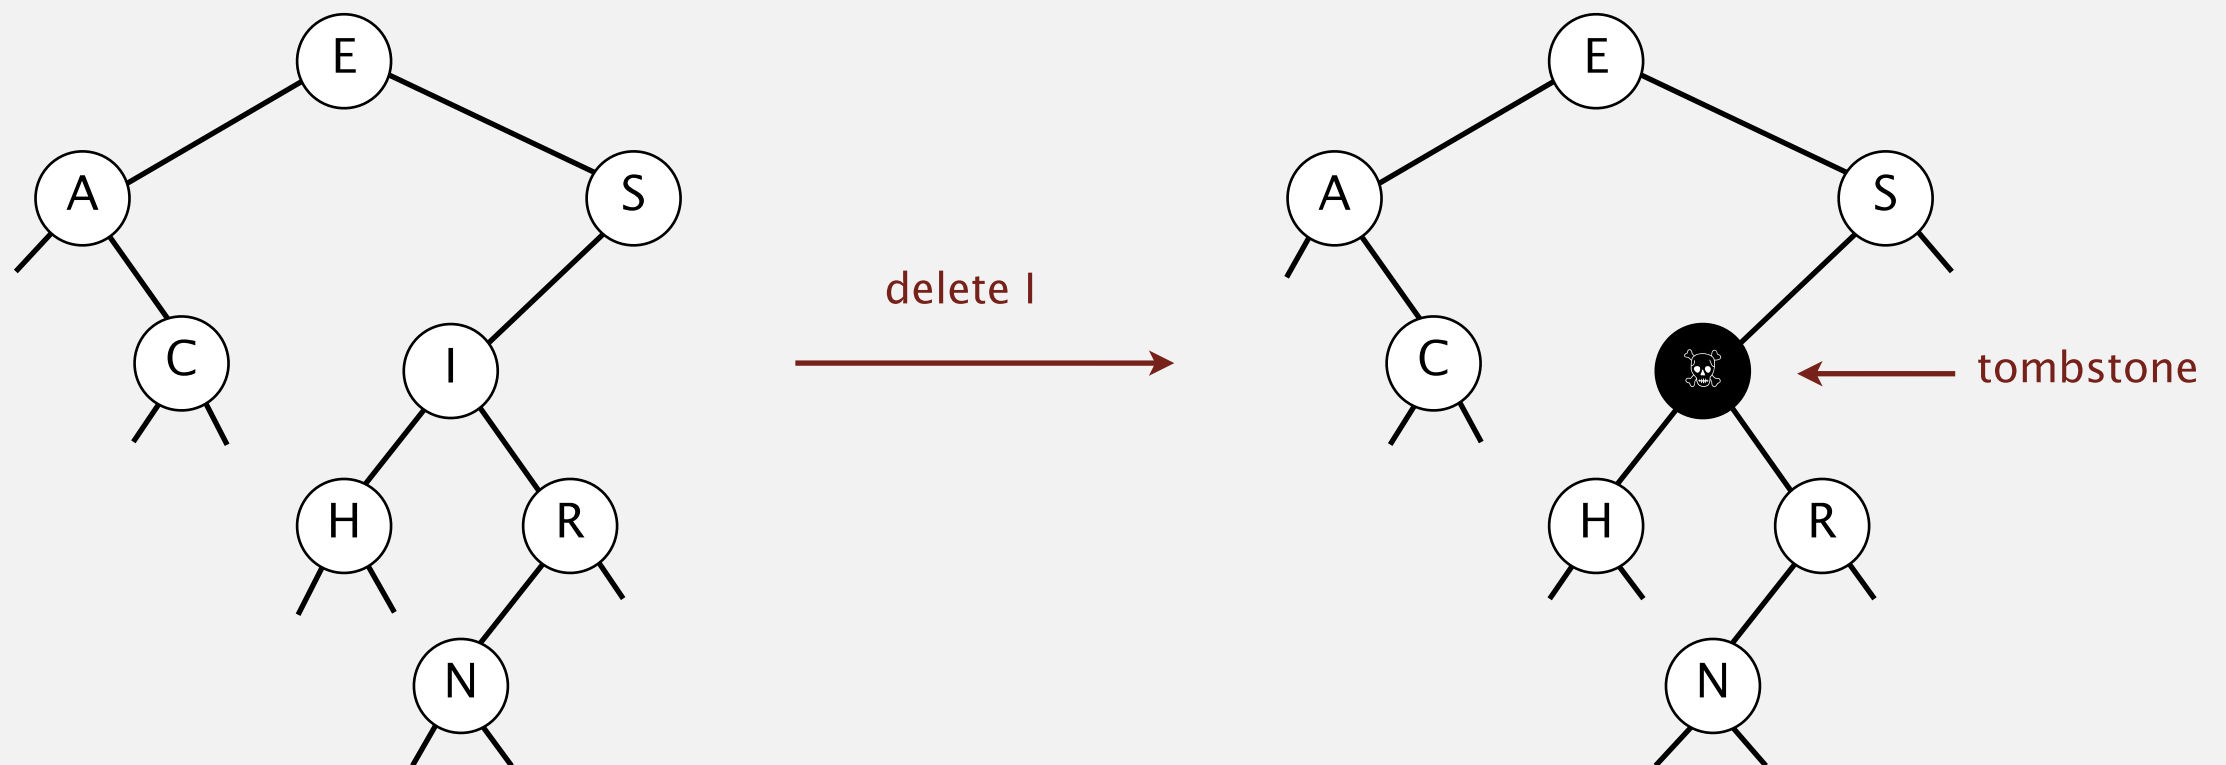

implementation	guarantee			average case			ordered ops?	operations on keys
	search	insert	delete	search hit	insert	delete		
sequential search (linked list)	$N$	$N$	$N$	$\frac{1}{2} N$	$N$	$\frac{1}{2} N$		<code>equals()</code>
binary search (ordered array)	$\lg N$	$N$	$N$	$\lg N$	$\frac{1}{2} N$	$\frac{1}{2} N$	✓	<code>compareTo()</code>
BST	$N$	$N$	$N$	$1.39 \lg N$	$1.39 \lg N$	???	✓	<code>compareTo()</code>

Next. Deletion in BSTs.

# BST deletion: lazy approach

To remove a node with a given key:

- Set its value to null.
- Leave key in tree to guide search (but don't consider it equal in search).

**Cost.**  $\sim 2 \ln N'$  per insert, search, and delete (if keys in random order), where  $N'$  is the number of key-value pairs ever inserted in the BST.

**Unsatisfactory solution.** Tombstone (memory) overload.

# Deleting the minimum

## To delete the minimum key:

- Go left until finding a node with a null left link.
- Replace that node by its right link.
- Update subtree counts.

```
public void deleteMin()
{  root = deleteMin(root);  }

private Node deleteMin(Node x)
{
    if (x.left == null) return x.right;
    x.left = deleteMin(x.left);
    x.count = 1 + size(x.left) + size(x.right);
    return x;
}
```

# Hibbard deletion

To delete a node with key  $k$ : search for node  $t$  containing key  $k$ .

**Case 0.** [0 children] Delete  $t$  by setting parent link to null.

deleting C

update counts after recursive calls

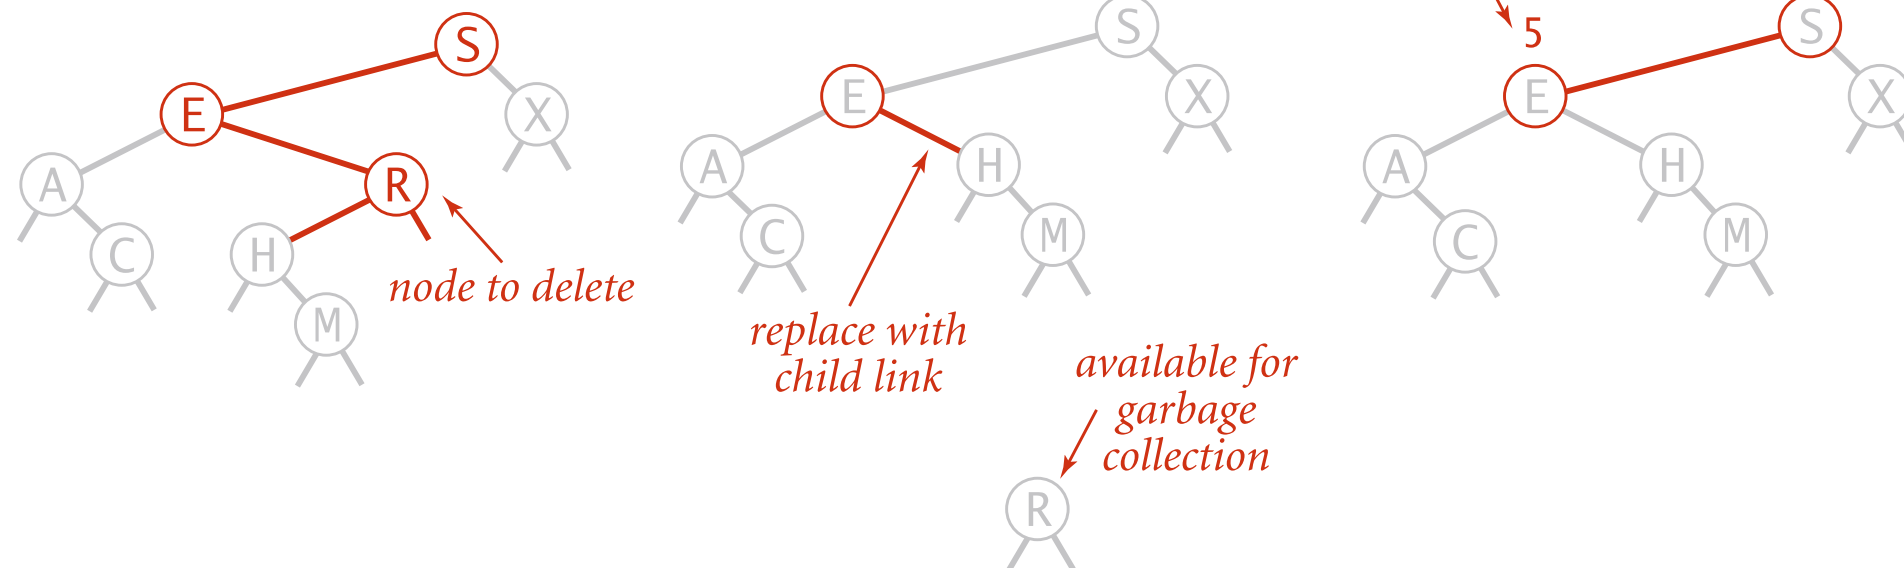

# Hibbard deletion

To delete a node with key  $k$ : search for node  $t$  containing key  $k$ .

Case 1. [1 child] Delete  $t$  by replacing parent link.

deleting R

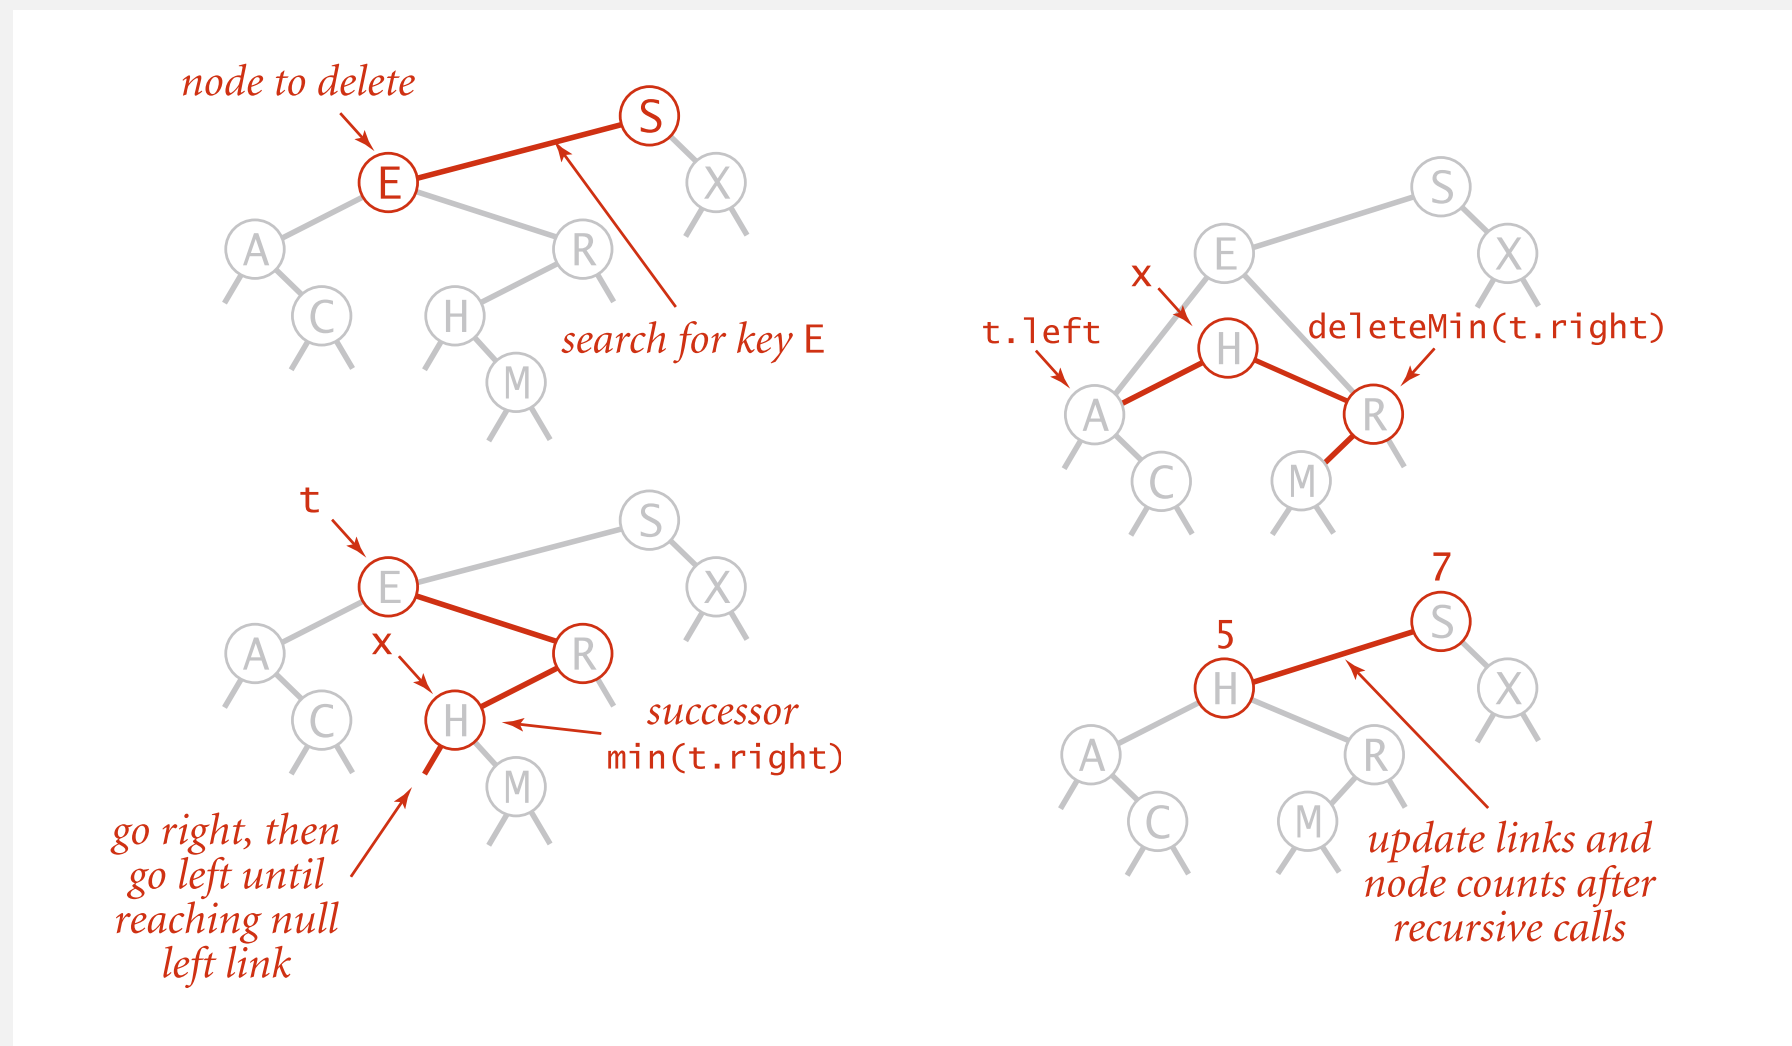

# Hibbard deletion

To delete a node with key  $k$ : search for node  $t$  containing key  $k$ .

## Case 2. [2 children]

- Find successor  $x$  of  $t$ .
  - Delete the minimum in  $t$ 's right subtree.
  - Put  $x$  in  $t$ 's spot.
- ←  $x$  has no left child  
← but don't garbage collect  $x$   
← still a BST

# Hibbard deletion: Java implementation

---

```
public void delete(Key key)
{  root = delete(root, key); }
```

```
private Node delete(Node x, Key key) {
```

```
    if (x == null) return null;
```

```
    int cmp = key.compareTo(x.key);
```

```
    if      (cmp < 0) x.left  = delete(x.left,  key);
```

```
    else if (cmp > 0) x.right = delete(x.right, key);
```

```
    else {
```

```
        if (x.right == null) return x.left;
```

```
        if (x.left  == null) return x.right;
```

```
        Node t = x;
```

```
        x = min(t.right);
```

```
        x.right = deleteMin(t.right);
```

```
        x.left = t.left;
```

```
    }
```

```
    x.count = size(x.left) + size(x.right) + 1;
```

```
    return x;
```

```
}
```

← search for key

← no right child

← no left child

← replace with  
successor

← update subtree  
counts

# Hibbard deletion: analysis

---

Unsatisfactory solution. Not symmetric.

Surprising consequence. Trees not random (!)  $\Rightarrow \sqrt{N}$  per op.

Longstanding open problem. Simple and efficient delete for BSTs.

# ST implementations: summary

implementation	guarantee			average case			ordered ops?	operations on keys
	search	insert	delete	search hit	insert	delete		
sequential search (linked list)	$N$	$N$	$N$	$\frac{1}{2} N$	$N$	$\frac{1}{2} N$		<code>equals()</code>
binary search (ordered array)	$\lg N$	$N$	$N$	$\lg N$	$\frac{1}{2} N$	$\frac{1}{2} N$	✓	<code>compareTo()</code>
BST	$N$	$N$	$N$	$1.39 \lg N$	$1.39 \lg N$	$\sqrt{N}$	✓	<code>compareTo()</code>

other operations also become  $\sqrt{N}$   
if deletions allowed

Next lecture. **Guarantee** logarithmic performance for all operations.
